

ABSTRACT OF THE DISCLOSURE

A flexible gap covering between an adjustable steering column of a motor vehicle and an instrument panel, on one side, is fastened to the steering column covering and, on the other side, is fastened to the instrument panel. A flexible gap covering which permits a large adjusting range of the steering column, is easy to mount and has a corresponding appearance, has an upper covering and a lower covering. The upper covering is formed of two parts, which are arranged above one another and are fixedly connected with one another in a joint overlapping area. At least one tensioning element is applied to the overlapping area on the side facing away from the vehicle occupant compartment.
